"Sequence conservation in the C-terminal region of spider silk proteins (Spidroin) from Nephila clavipes (Tetragnathidae) and Araneus bicentenarius (Araneidae).";
J. Biol. Chem. 269:661-663(1994).
-!- FUNCTION: Spiders major ampullate silk possesses unique characteristics of strength and elasticity. Fibroin consists of pseudocristalline regions of antiparallel beta-sheet interspersed with elastic amorphous segments.
-!- SUBUNIT: MAJOR SUBUNIT, WITH SPIDROIN 2, OF THE DRAGLINE SILK.
                                                                                                                                                                                                                                                                                                                                                                                                                                          VARSPLIC

CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome c + 2 H(2)O.

PATHWAY: Respiratory chain; terminal step.

PATHWAY: Respiratory chain; terminal step.

SUBCELLULAR LOCATION: Integral membrane protein. Mitochondrial inner membrane. Contains 12 potential transmembrane domains.

SIBLEARITY: BELONGS TO THE HEME-COPPER RESPIRATORY OXIDASE FAMILY.

CAUTION: SOME POSITIONS ARE MODIFIED BY RNA EDITING.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        chain that catalyzes the reduction of oxygen to water. Subunits 3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Electrons originating in cytochrome c are transferred via the copper A center of subunit and heme a of subunit 1 to the bimetallic center formed by heme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Biol. CATALYTIC ACTIVITY: 3-carboxy-3-hydroxy-4-methylpentanoate + CoA = acetyl-CoA + 3-methyl-2-oxobutanoate + H(2)O.

PATHWAY: Leucine biosynthesis; first step.

SUBUNIT: Homotetramer (By similarity).

SIMILARITY: BELONGS TO THE ALPHA-IPM SYNTHETASE / HOMOCITRATE

DNA Res. 8:205-213(2001).

-i- FUNCTION: Catalyzes the conversion of zeta-carotene to lycopene via the intermediary of neurosporene. It carries out two consecutive desaturations (introduction of double bonds) at positions C-7 and C-7' (By similarity).

-i- CATALYTIC ACTIVITY: Zeta-carotene + AH(2) + O(2) = neurosporene
